

Uber Performance Analysis

Problem Statement

Uber's Delhi operations handle thousands of ride bookings daily across different vehicle types and locations. Without proper analysis, operational challenges such as high cancellations, uneven demand patterns, booking failures and revenue leakage become difficult to identify and manage.

To address these challenges, a centralized Power BI dashboard was developed to transform raw ride-booking data into meaningful business insights. The dashboard focuses on:

- Revenue trends and ride profitability
- Booking demand patterns across hours, days and months
- Vehicle category performance and contribution
- Booking completion vs cancellation behavior
- Driver and customer cancellation analysis
- Revenue loss caused by failed and incomplete bookings

Project Objective

The objective of this project is to design and develop a comprehensive, interactive Power BI dashboard to analyze Uber Delhi's operational and financial performance for the year 2025.

The dashboard aims to transform raw transactional data into actionable business intelligence by :

- Monitor platform performance through KPIs such as bookings, revenue, completion rate and losses
- Analyze booking and revenue trends to identify peak demand periods and underperforming months
- Evaluate the performance of all six vehicle categories to understand revenue contribution and demand distribution
- Investigate the root causes of booking failures, cancellations and incomplete rides
- Identify opportunities to improve operational efficiency and revenue growth
- Convert raw transactional data into actionable insights that support decisions across pricing, fleet, and driver management

Dataset Overview

Column Name	Description
Date	The specific calendar date of the booking.
Time	The timestamp when the booking was requested.
Booking ID	A unique identifier for every booking request.
Booking Status	Completed, Cancelled by Driver/Customer, No Driver Found, Incomplete
Customer ID	Unique identifier for the customer
Vehicle Type	Auto, Bike, Go Mini, Go Sedan, Premier Sedan, Uber XL
Pickup Location	The area where the customer requested pickup.
Drop Location	The destination area.
Cancelled Rides by Customer	Customer-initiated cancellation flag
Cancelled Rides by Driver	Driver-initiated cancellation flag
Incomplete Rides	Flag for rides that started but were not completed (1 = Yes, 0 = No).
Customer Cancellation Reason	Reason given by customer for cancellation
Driver Cancellation Reason	Reason given by driver for cancellation
Incomplete Rides Reason	Reason why the ride ended prematurely
Booking Value	Fare amount in INR (available for Completed and Incomplete rides)
Ride Distance	Distance covered during the ride (in km)
Driver Ratings	Driver rating given by customer (1–5)
Customer Ratings	Customer rating given by driver (1–5)
Payment Method	Method used for payment (UPI, Cash, Credit Card, Uber Wallet, Debit Card)

Key Insights

- Demand peaks in **January, March and July** — dips consistently in **February and September**, indicating predictable seasonal cycles likely driven by weather, holidays, or events.
- **6 PM** is the peak booking hour across all 7 days of the week, generating **1,700–1,822 bookings per hour**, highlighting strong evening commute demand.
- Weekdays generate significantly higher **booking volume**, while weekends produce higher revenue per ride.
- Monthly revenue remains stable at **₹3.4–4M** per month with no growth trend across 2025. **March peaks at ₹4M**, the highest monthly revenue — correlating with the March bookings peak.
- Average revenue per ride remains almost identical across all vehicle categories (**₹505–₹512**), meaning **revenue growth** is driven by **booking volume** rather than pricing differences.
- Weekend rides earn **₹540** per ride versus **₹497** on weekdays — an **8.6%** premium despite lower volume (27K weekend vs 66K weekday).
- **Auto, Bike and Go Mini** together contribute **67% of total revenue** — confirming a **price-sensitive** user base choosing smaller, affordable vehicles.
- Driver cancellations (**18%**) are more than double the customer cancellations (**7%**) and have remained flat throughout the entire year with **no improvement**.
- The combined financial impact: **₹4.6M** in actual uncollected incomplete ride fares plus **₹24.5M** in estimated cancellation revenue loss totals **₹29.1M** in **preventable annual loss**

Recommendations

- Implement **surge pricing** and **targeted driver incentives** during the 5–7 PM peak demand window to improve **ride availability** and **maximize revenue**. The **6 PM peak** is consistent across all 7 days and represents the clearest commercial pricing opportunity in the dataset
- Run **targeted promotions** and **driver incentives** in **February and September** to counter the predictable seasonal demand dips identified in both booking and revenue data.
- Expand **focus on affordable vehicle** categories such as **Auto, Bike** and **Go Mini**, as they contribute the majority of platform **revenue**.
- Develop **targeted strategies** for **premium vehicle** categories to improve their **booking volume and utilization**. They already earn marginally higher per-ride revenue but are constrained by demand, not supply.
- Since driver cancellations are the biggest issue, the company should focus on **driver accountability, incentives, and better ride allocation systems**.
- Since UPI dominates transactions **(45%)**, the platform can introduce **cashback offers** and loyalty rewards for digital payments.
- Weekend rides generate higher revenue per ride, so **weekend-focused pricing** and **promotional strategies** can help maximize profits during weekends.
